

Features and Benefits

Comprehensive Notification

REACT provides notification to large and targeted audiences in a wide variety of ways. It is essential that critical communication be flexible to ensure that should one method of communication fail, that alternate methods are available. REACT provides notification to computer desktops, public displays, cell phones, telephones, and email. Through integration, REACT can also automate notification over PA systems as well.

Immediate Notification

REACT quickly and reliably relays critical communication to desktop systems, public displays, telephones and wireless devices to ensure that the messages are received by desktops and public displays within seconds, not minutes, reducing the risk of employees taking incorrect action or putting themselves in danger.

Tailored / Targeted Messages

REACT offers its users countless options. If appropriate, every screen in a facility can simultaneously display different media, including still images, video, text, and sound. Customized instructions specific to a location, responsibility, event or critical event can be distributed to each REACT Player in any language, tailored specifically for the individual.

Alert Management

Whether triggered manually, or triggered automatically through integration with current security and life safety infrastructure, the REACT Console updates operators with the most up-to-date information available about each alert and can track the history of updates by content, location, and time. Whether on-site, or across town, REACT Console operators have access to the information they need to manage critical events across their organizations.

Management of Multiple Scenarios

REACT Users can view multiple alerts, showing the highest priority events as they are sent, while reviewing instructions and procedures from other alerts at any time.

Flexible Launching of Alerts

REACT provides secure and flexible methods of giving individuals throughout the organization the ability to take advantage of the features of REACT. Single Button Alerts provide a low cost, easy to install, and easy to customize panic button solution on any desktop in an organization. Mobile users may use REACT to launch alerts from any location as a situation occurs.

Efficient and Economical

REACT works on existing network infrastructure, with virtually no footprint. REACT software runs on current Windows Systems and does not require extensive purchase of new hardware. It is easy to start small and grow with no limits on the number of recipients.

Compliance and Reporting

REACT provides full reporting for all events initiated and managed in the system. With REACT, reports are immediately available to see user action, notification, and confirmed receipt.
